Stimulant addiction is a deadly game

So we changed the rules

Stimulant use disorders (StimUDs) such as meth and cocaine addiction are the hardest to beat and the hardest to treat. StimUDs are different from other substance use disorders like opioids, for which three FDA-approved pharmacotherapies have been in use for decades.

61% of StimUD patients relapse following traditional treatment (Brecht et al, 2015). Further, they are twice as likely as opioid use disorder patients to drop out of treatment, and 30% more likely to go to the ED. There’s a better way.

The key to successful stimulant use disorder treatment is activating the brain’s reward center. Affect developed a revolutionary digital care model specifically for stimulants that offers the rewards and incentives of contingency management through a unique app experience. It also integrates a full care team of advocates, licensed counselors and doctors for evidence-based behavioral therapy and health management.

The entire program is delivered through an app that runs on any smartphone: a safe and discrete program that rewards healthy behaviors.

Affect’s intensive intervention is available whenever and wherever the member needs it through a personalized program that addresses their unique needs, fits their lives, and teaches skills to build new ones. It’s affordable and easy to use, so the period of care lasts longer and the disorder can be successfully managed into remission.

Affect partners with the Health Plan of Nevada and its provider network to fight the stimulant crisis one recovery journey at a time.

We win together

Affect’s integrated digital program revolutionizes methamphetamine and cocaine use disorder treatment

Our digitally-native treatment program is hyper convenient, discrete, and effective. By combining a digital therapeutic app with an integrated care model, our program delivers member retention and abstinence rates substantially higher than traditional treatment programs.

**Rewards and Incentives With Game Design Theory**

Contingency Management (cash incentives for program adherence) create compulsion loops that stimulate the brain’s reward system to replace drug dependency and reinforce healthy behaviors.

**A Holistic Curriculum and Skills to Recover and Rebuild**

The Matrix Model provides the foundation for a methodology that goes beyond traditional recovery programs to address SDOH skills like employment and secure housing.

**Clinical Care and Recovery Community at the Fingertips**

Members attend group and individual therapy and complete drug screens, all from the app. It tracks health data, manages appointments, and give reminders to help patients stay on their recovery journey.

How to refer a patient:

Patients must be over 18 and have a previous or current history of stimulant use (including meth, cocaine, and prescription stimulants).

What happens once I make a referral?

- The care specialist will obtain basic information – and will need to speak directly to the member. The call will take roughly 10 minutes.
- The member will be provided with basic information explaining how to access the intake appointment, how to download our patient app, and how to reach us in the event they need anything between then and the intake appointment.
- At the conclusion of the call, the care specialist will schedule the 60 minute counselor intake appointment, ideally within 72 hours of the call being placed.
- After a member is admitted, our care team will collaborate with the referring partner and other providers as appropriate to share care plans and manage the overall health of the member.

We work directly with case managers, hospitals, providers, social workers, and the justice community to identify patients in need and to offer them the quality care they deserve.

Let’s work together to affect change and win the battle to treat stimulant use disorders.

Affect’s research is supported by the National Institute on Drug Abuse
